

LCX Sales Automation Engine

How 7,850 tokens become closed listings — the complete build

Build report · July 2026

Watches the whole token market · knows who can be listed and who will pay · does the legwork · you close.

10

jobs run it daily

Eight steps from raw token data to a signed listing

A reply stops everything

automation pauses, a human takes over

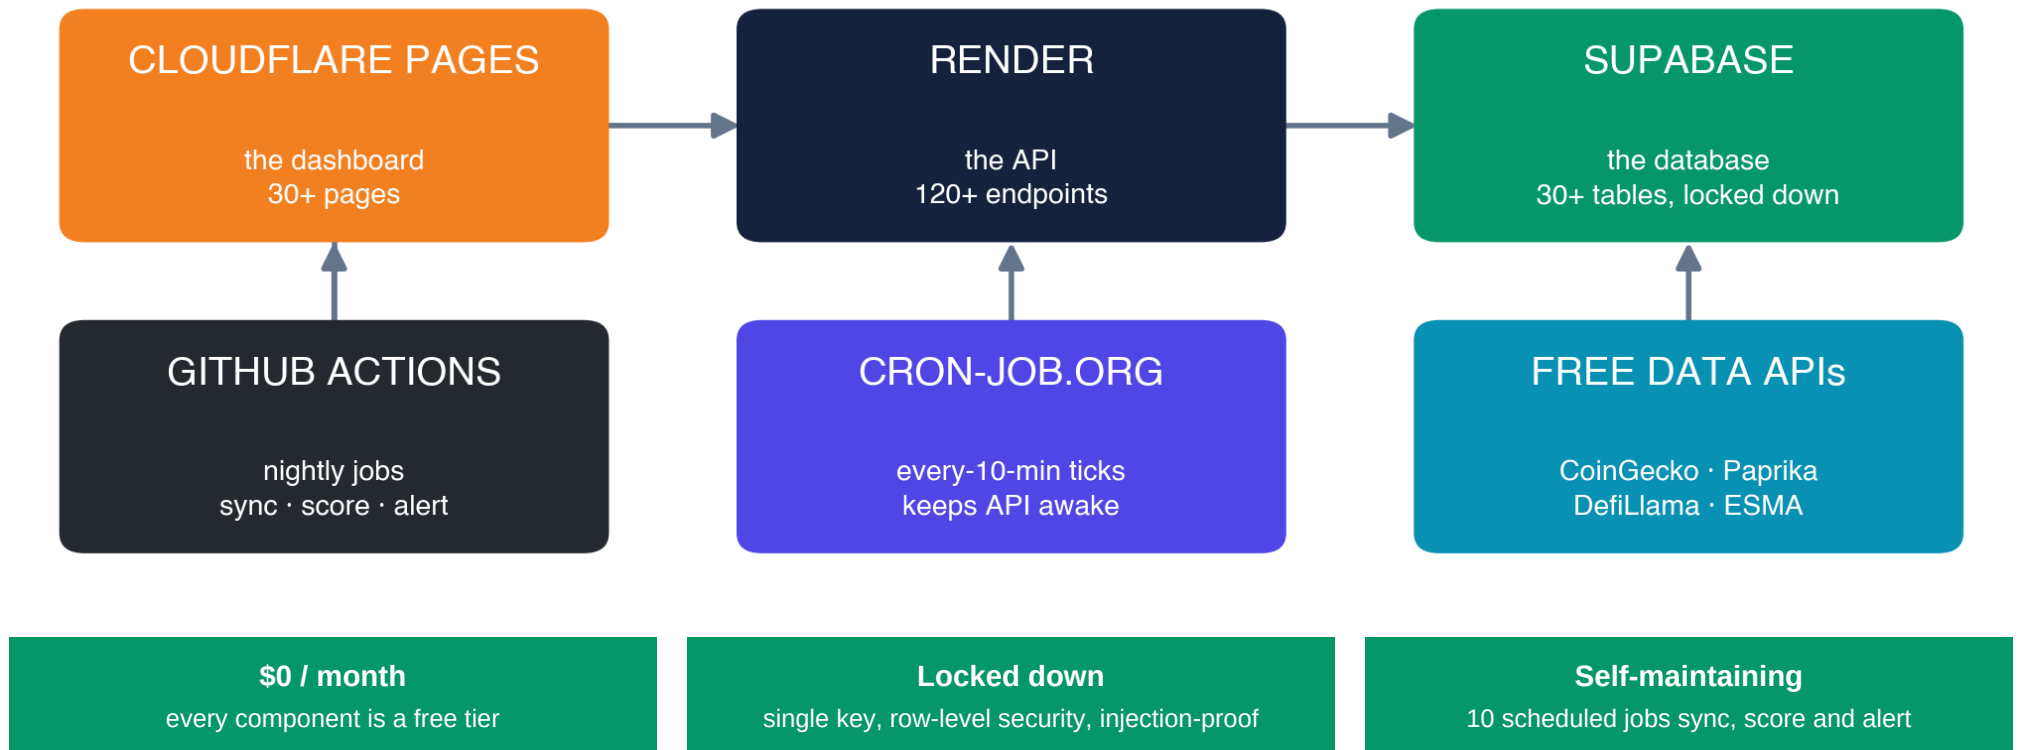

LinkedIn & Telegram: you click send

the system only drafts — zero account risk

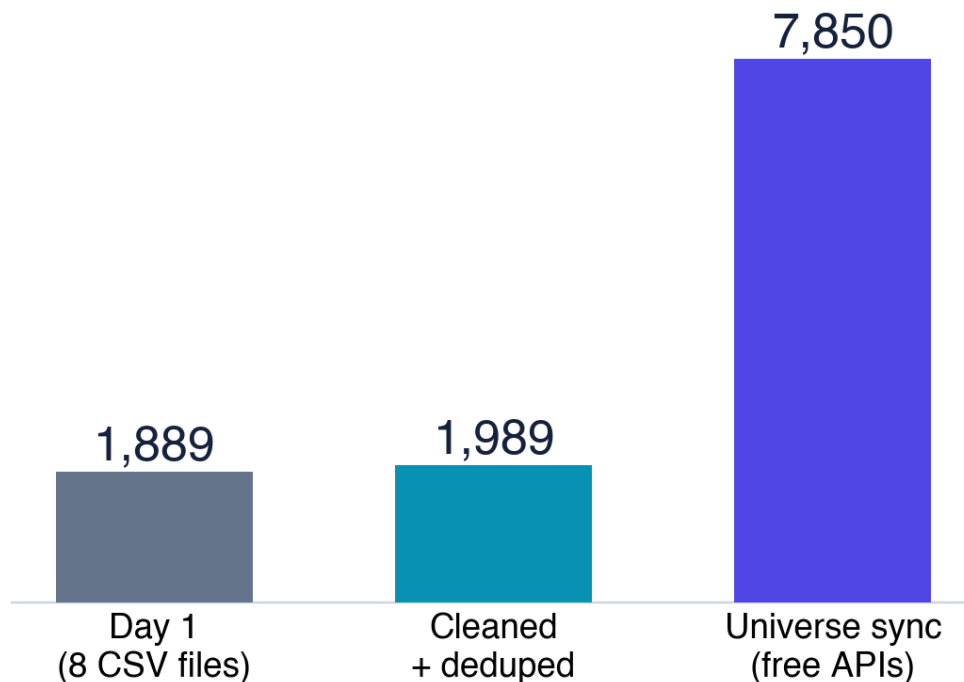

Money is never touched

billing is tracking only, by design

Six services, one platform — all on free tiers

The universe grew 4x — and now refreshes itself

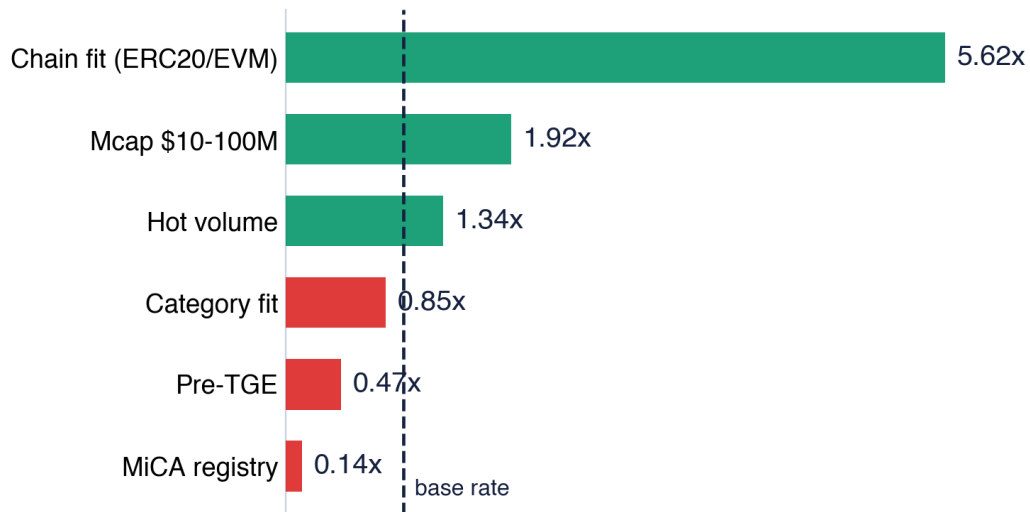

Five free APIs, one pipeline. CoinGecko, CoinPaprika, DefiLlama, GeckoTerminal and the ESMA registry feed a single staging pipeline that deduplicates and merges identities safely.

Only listable candidates get in. A quality gate admits projects by rank, market cap, volume or newness — junk stays out, so the queue stays clean.

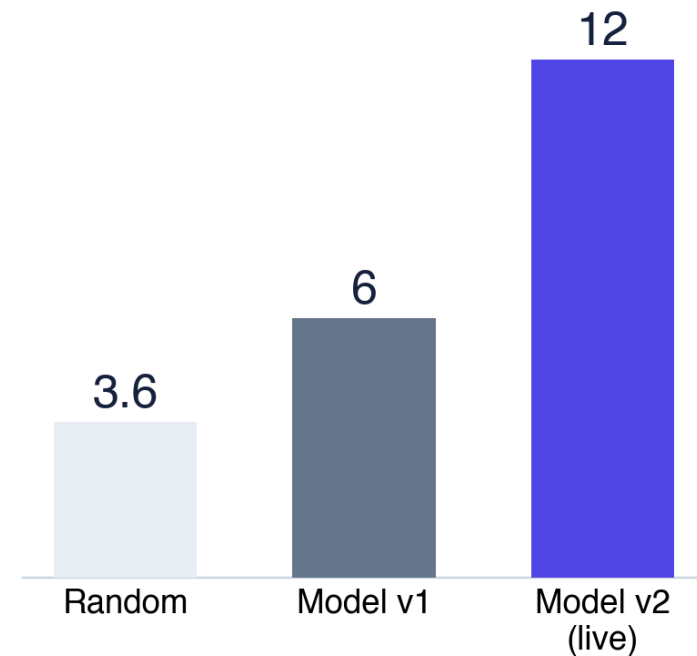

Fresh every morning. Market data on 5,600+ projects refreshes nightly and flows straight into the scores. New tokens are discovered daily from DEX launches.

Scoring that predicts who will actually pay

Every project gets two scores: **may we list them** (EU + US regulatory rules) and **will they pay** (a model calibrated on LCX's own 36 closed deals). The queue only ranks projects that pass both.

Past payers found in top 10% of the queue (out of 36)

The data corrected our intuition: being an ERC20/EVM token predicts paying 5.6x better than average — while MiCA-registry presence, assumed a positive, actually predicts against (0.14x). The live model finds past payers 3.3x better than chance.

Automated where safe — assisted where it counts

EMAIL

fully automatic sends in business windows, bounces auto-pause

LINKEDIN

one-click assisted drafts + profile links ready, you press send

TELEGRAM

assisted only no send path exists in the code

REPLIES

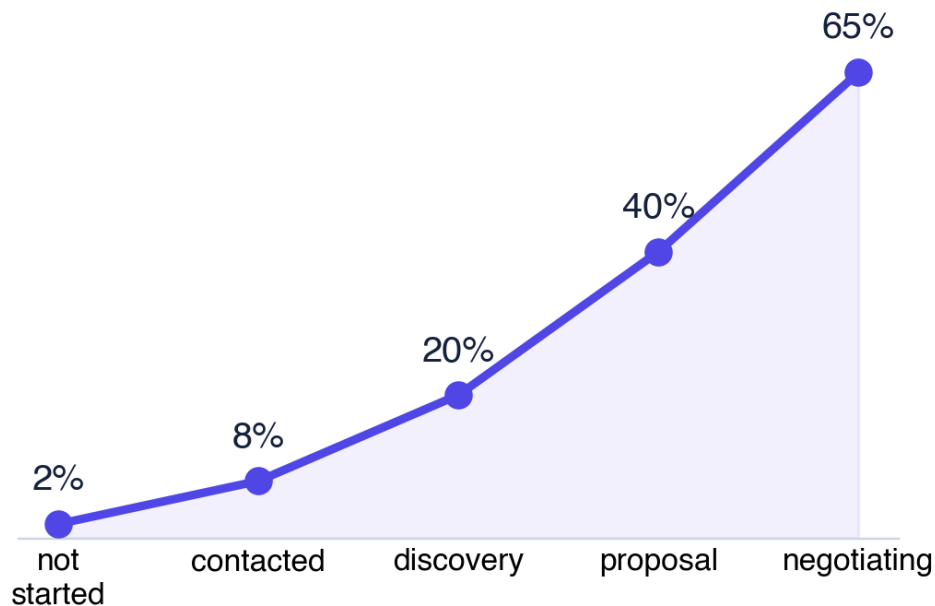

captured automatically every channel funnels to one handoff queue

Each lead runs a 5-touch cadence across channels over ~35 days, built from a pre-approved claim library — no invented promises, always a question. Daily caps keep accounts safe (7 LinkedIn connects, 50 emails).

When someone replies, the goal is one move: pull them to Telegram. Three ready-made reply drafts appear — meeting, Telegram, or info angle — and every one ends with the Telegram invite, where you close personally.

Your morning: open the Send Queue → 12 pre-written LinkedIn touches → click through them in 15 minutes. Overnight replies are already paused, drafted and waiting.

A deal desk that knows what every deal is worth

Every deal carries a live win probability — stage, priority and neglect all move it. 10,000 simulations turn the pipeline into a P10 / P50 / P90 revenue forecast.

Kanban board

stalled deals flag themselves

Tiered proposals

Gap analysis: projects already paying — just not us

40

proven listing budgets found,
live on other exchanges but not
LCX

Project	Listed on	The angle
Illuvium	37 exchanges	pays for listings routinely — LCX is the missing regulated EU venue
Unitas	9 exchanges	actively expanding coverage right now
Reppo	5 exchanges	early expansion — the highest-propensity moment

And the rest of the intelligence layer, one click away:

competitor listed your lead? bell rings
that night

All 50 planned features are built

17 live in production — the universe, scoring, queue, send queue, gaps, deal board, forecasts and alerts you use today.

33 built and waiting — deal desk, AI console, CRM and integrations sit on a branch, tested and reviewed. The live dashboard stays untouched until you say deploy.

Upgrade paths are one key away: an Anthropic key turns 10 AI features from deterministic to LLM-powered; provider keys activate e-sign, calendar and social monitoring.

Four small switches left to flip

Switch	Effort	What it unlocks
Activate GitHub Actions	3 min	the nightly job schedule runs itself
Set cron-job.org to POST	1 min	the every-10-minute outreach + discovery ticks fire
Connect email (Resend)	30 min	the email channel goes fully live with automatic reply capture
Say “deploy”	your call	the 33 branch features reach the live dashboard

Bottom line: a production platform that watches the entire token market, knows who can be listed and who will pay, does the outreach legwork, and hands you the close — for \$0/month. And it compounds: every closed deal makes tomorrow's queue smarter.
